Rationales

▼ 1 — C

Choice C is the best answer. Text 1 claims that mandatory voting results in elections that "better reflect the preferences of the country." Singh and Roy disagree. They claim that more voters doesn't equal more quality votes—instead, they argue that forced voting may lead to less-informed votes that "may not reflect [voters'] actual preferences."

Choice A is incorrect. Neither text mentions the population size of countries that require voting, or how that might affect election outcomes. Choice B is incorrect. Neither text discusses the effects of mandatory voting on other forms of political engagement. Choice D is incorrect. Neither text discusses the ease or difficulty of the voting process in countries that require voting.

▼ 2 — D

Choice D is the best answer. Both authors agree that Ludington's story has been widely celebrated and revered by Americans, even if they disagree on its accuracy. Text 1 states that Ludington has inspired postage stamps, statues, and TV series, and Text 2 states that

many articles and books have been written about her. Thus, both authors acknowledge the popularity of Ludington's story.

Choice A is incorrect. Neither author claims that Ludington had a significant impact on the war. Text 1 doesn't mention how Ludington's ride affected the war overall, and Text 2 suggests that Ludington's ride may have been exaggerated or invented over time. Choice B is incorrect. Neither author claims that Ludington's route has been verified by historians. Text 1 claims she rode 40 miles through Putnam County, but doesn't cite any sources for this information, while Text 2 suggests the ride may not have even happened. Choice C is incorrect. This choice misreads text 2. Neither author claims that Ludington was not a real person, only that her ride may not have happened. Both authors seem to treat Ludington as a genuine historical figure.

▼ 3 — A

Choice A is the best answer. Both texts state that tropical mountain bird species have limited ranges or habitats, although they disagree on the reason for this. Text 1 claims that temperature is the main factor that determines where these birds can live, while Text 2 claims that competition with other species is the main factor. However, both texts agree that these birds are not able to survive in many kinds of areas.

Choice B is incorrect. Neither text mentions the tools or methods that scientists use to observe these birds, either now or in the past. Choice C is incorrect. Neither text mentions anything about how these birds build their nests. Choice D is incorrect. Neither text provides any information about the genetic similarity of these birds, so we have no evidence that either author would agree with this statement.

▼ 4 — B

Choice B is the best answer. Author 1 states that Ailey had a "deep admiration for jazz music" and that he "helped bring jazz to life for his audiences." Author 2 states that "Jazz is present throughout Ailey's work." While the authors name different aspects of Ailey's work as the most influenced by jazz, they agree that jazz was a strong influence.

Choice A is incorrect. This isn't something that either text claims. Neither text mentions how Ailey's dancers felt about his approach as a choreographer, so we have no evidence that either author would agree with this. Choice C is incorrect. This isn't something that either text claims. Neither text mentions how familiar audiences were with any aspect of Ailey's works, so we have no evidence that either author would agree with this. Choice D is

incorrect. This isn't something that either text claims. Neither text mentions any genre of music other than jazz, so we have no evidence that either author would agree with this.

▼ 5 — B

Choice B is the best answer. Text 1 states that literary scholars ignore regional cookbooks most of all, even when they have historical significance and are well written. So the author of Text 1 wouldn't be surprised that scholars ignored Edna Lewis's cookbook.

Choice A is incorrect. We can't infer that this is how the author of Text 1 would regard the situation. Text 1 never suggests that scholars are dismissive of popular works in general. Instead, Text 1 says that scholars ignore food writing specifically, despite its popularity—and despite the fact that it can be historically significant and complex. Choice C is incorrect. We can't infer that this is how the author of Text 1 would regard the situation. Text 1 never suggests that elements of other genres should be kept out of cookbooks. Choice D is incorrect. We can't infer that this is how the author of Text 1 would regard the situation. Text 1 never discusses how food writing is or should be marketed.

▼ 6 — A

Choice A is the best answer. Text 1 states that cassava's "rise to popularity was slow" in West Africa. Text 2 also describes cassava's "slow adoption into the diet of West Africans." While the two texts identify different causes for this slow adoption, both agree that cassava took a long time to catch on.

Choice B is incorrect. This isn't something that either text claims. Cassava is the only crop discussed in the passages, so we have no basis to draw conclusions about what the authors might say about "several" crops. Choice C is incorrect. This isn't something that either text claims. Neither text mentions the "climate of the West African coast," so we have no evidence that either author would agree with this. Choice D is incorrect. This isn't something that either text claims. The 1500s were when cassava was brought to West Africa, but neither text describes how cassava is cooked, nor do they make any claims about when cooking methods were developed.

▼ 7 — D

Choice D is the best answer. Text 1 states that the moon was formed from the debris "over the course of thousands of years," while Text 2 states that the moon's formation happened "immediately after impact, taking just a few hours." This shows a clear difference in how the authors view the evidence for the speed of the moon's formation.

Choice A is incorrect. While Text 2 suggests that the moon formed over "just a few hours" and Text 1 says it took "thousands of years," neither one mentions when that formation occurred. Choice B is incorrect. While Theia isn't mentioned in Text 2, neither text describes or disputes evidence of Theia's existence. Choice C is incorrect. Neither text makes any claims about the similarity or difference between the moon's surface and Earth's surface.

▼ 8 — C

Choice C is the best answer because it directly applies the research findings described in Text 2 to the situation underlined in Text 1. The underlined sentence in Text 1 describes a common scenario in which two friends are deciding on a lunch location. Text 1 goes on to explain that people often don't reveal their true preferences in such situations, instead claiming they're fine with any option so that they can appear more easygoing and likable. Text 2 presents research that advises against this approach, stating that people who don't express their preferences aren't viewed as more likable and that this behavior actually makes decisions more difficult for others. Since Text 2 specifically argues against the strategy of concealing preferences and indicates negative outcomes from doing so, the author of Text 2 would most likely recommend stating a preference about where to eat.

Choice A is incorrect because nothing in Text 2 suggests that canceling plans is a good solution. The author of Text 2 is addressing how to make joint decisions effectively (through stating your own preference), not advocating for avoiding such decisions entirely. Choice B is incorrect because asking where the friend typically likes to eat still avoids stating one's own preference. While this approach might seem considerate, it continues the pattern of not revealing true preferences that Text 2 identifies as problematic. Choice D is incorrect because changing the subject would avoid making any decision altogether, which contradicts the implied advice in Text 2. The author of Text 2 presents research suggesting that directly engaging with the decision by stating preferences helps others make decisions and makes you appear more likable.

▼ 9 — C

Choice C is the best answer because it describes how the ecologist in Text 2 would most likely respond to the author's conclusion in Text 1 based on the information provided. The author of Text 1 states that the pink color of flamingo feathers comes from pigments carried by the brine shrimp flamingos consume. The author of Text 1 concludes that this means that a flamingo that is pinker than another flamingo must have eaten more shrimp. However, according to Text 2, ecologist Juan Amat has found that flamingos can also affect how pink

they look through grooming, when they move ingested pigments from a gland near the tail to their feathers. This indicates that not all the pigments available from the shrimp a flamingo has eaten automatically end up coloring the flamingo's feathers; some may or may not be applied later. Since grooming is also a factor, the ecologist (Amat) in Text 2 would most likely respond to the conclusion in Text 1 that pinker flamingos have eaten more shrimp by pointing out that the amount of shrimp eaten isn't the only thing that influences flamingos' coloring.

Choice A is incorrect. Although Text 2 states that the ecologist has found that flamingos can move pigments to their feathers from a gland near their tail, there is no indication that their tail feathers are pinker than their other feathers. Moreover, the point that tail feathers are pinker than other feathers wouldn't logically address the idea that the quantity of shrimp eaten is what determines a flamingo's coloring. Choice B is incorrect because Text 2 indicates that the ecologist has found that flamingos' feathers do sometimes look pinker and gives no indication that this change in color is particularly subtle. Moreover, the point that most observers wouldn't notice a change wouldn't logically address the idea that the quantity of shrimp eaten is what determines a flamingo's coloring. Choice D is incorrect because nothing in Text 2 suggests that the ecologist would argue about flamingos' shrimp consumption. Although Text 2 indicates that the ecologist has found that flamingos may make themselves look pinker during mating season, this is addressed in terms of grooming habits; apart from referring to food as a source of pigments, Text 2 doesn't discuss the diet of flamingos at all.

▼ 10 — A

Choice A is the best answer. The author of Text 1 states that Soyinka's progression as a playwright can be considered to fall into three periods, implying that this is a helpful way to understand his works. The author of Text 2, on the other hand, challenges this view and says that it overlooks potential commonalities and differences in Soyinka's work across what Text 1 calls distinctive stylistic phases.

Choice B is incorrect. This choice overstates the central claim of Text 2. The author of Text 2 argues against the chronological progression supported in Text 1, but does not go so far as to say that Soyinka's style remained consistent. In fact, Text 2 points out "significant differences in styles and content" among Soyinka's plays. Choice C is incorrect. Neither of the texts mention Soyinka's poetry, nor do they rank his dramatic writing relative to his other work. Choice D is incorrect. Neither text discusses the political aspects of Soyinka's plays, nor do they make any claims about whether they have changed over time.

▼ 11 — D

Choice D is the best answer because it presents a statement about microbes with which Fierer's team (Text 1) and the author of Text 2 would most likely agree. Text 1 states that microbes usually thrive in very harsh conditions, and so Fierer's team was surprised when samples collected from an extremely cold and dry area of Antarctica didn't appear to contain any life. Fierer's team says that though this doesn't conclusively prove there are no microbes in the area, it suggests that microbes would have a notably difficult time surviving in the environment. The author of Text 2 says it's unlikely that there would be no microbes at all in the Antarctic study site from which Fierer's team retrieved soil samples and that there may have been hard-to-detect microbes in the samples. However, the presence of only a few microbes in the Antarctic samples rather than the billions found in a typical soil sample (which would presumably be much easier to detect) would illustrate conditions in the Antarctic soil that make it difficult for microbes to thrive. Since Fierer's team says that the seeming absence of microbes in the Antarctic samples suggests an unusually harsh environment and the author of Text 2 says that even if there are a few undetectable microbes in the samples, the relatively tiny number of microbes would also suggest an unusually harsh environment, then Fierer's team and the author of Text 2 would most likely agree that most microbes are unable to withstand the soil conditions at the Antarctic study site.

Choice A is incorrect. The samples taken by Fierer's team were from an area of Antarctica that is described in part as extremely dry, and these samples didn't appear to have any life. Therefore, even though these samples also came from an extremely cold area, Fierer's team wouldn't argue based on the evidence available that microbes were better able to survive in dry conditions than in areas with harsh temperatures. Moreover, the author of Text 2 says that microbes are found in virtually every environment on Earth but doesn't compare dry environments and harsh environments. Choice B is incorrect. Nothing in Text 1 indicates that another collection of samples from the Antarctic study site might yield different results from the samples already taken by Fierer's team. The author of Text 2 does state that microbes are found in virtually every environment on Earth and suggests that new technology may be better able to detect so few microbes in a soil sample, but the author of Text 2 concludes that the unusual absence of microbes in the Antarctic samples is evidence of the harsh Antarctic environment. Therefore, there is no reason to believe that the author of Text 2 thinks that another sample drawn from that same harsh environment would yield a much higher number of microbes. Choice C is incorrect. The author of Text 2 does speculate that there may have been so few microbes in the Antarctic samples that current technology

couldn’t detect them, but the author doesn’t speculate that this is due to the size of the microbes. Moreover, nothing that Fierer’s team says suggests that they are speculating that their samples might have microbes that are smaller than microbes in typical soil samples.

▼ 12 — D

Choice D is the best answer because Text 2 presents a possible solution to the problem identified in Text 1—that is, how disparities in the criteria used by different countries to define urban settlements make it "difficult for researchers to compare aspects of urbanization in different countries." Text 2 describes the creation of a shared framework for studying global urbanization: "global definitions of common types of settlements" and a "new measure called the ‘degree of urbanization’" that "allows researchers to better understand global urbanization rates."

Choice A is incorrect. Although Text 2 mentions "a group of six international organizations" that developed criteria and a measure related to settlements and urbanization, no organization or institution is singled out to perform further research. Choice B is incorrect because both texts are about urbanization research and neither mentions any other fields of study. Choice C is incorrect. Text 2 discusses a possible solution to the terminological problem in global urbanization research, not additional areas of difficulty in the field.

▼ 13 — A

Choice A is the best answer because it most accurately states how the author of Text 2 would most likely respond to the argument presented in Text 1. In arguing that graphic novels shouldn’t be classified as literature and are more comparable to film, Text 1 claims that language plays a relatively limited role in graphic novels: images, not language, are the primary means by which graphic novels tell their stories, and language is used "only sparingly"—that is, comparatively very little—in the form of captions and dialogue. However, the author of Text 2 asserts that language in graphic novels is as equally vital for conveying meaning as images are, since without captions and dialogue, readers wouldn’t be able to make sense of the narrative. Moreover, the author of Text 2 argues that there are many graphic novels that are "beautifully written" and whose use of language is as accomplished as any standard novel. Because Text 1 argues that language is subordinate to images in graphic novels, whereas Text 2 highlights how language is an essential component of a graphic novel’s storytelling, it can reasonably be inferred that the author of Text 2 would say that language plays a more important role in graphic novels than the author of Text 1 recognizes.

Choice B is incorrect. Although Text 1 indicates that graphic novels shouldn't be classified as literature based on their limited use of language, there's no indication that the author of Text 1 considers this limited use of language as a flaw, just that it doesn't fit the particular definition of "literature" proposed in the text. Even if Text 1 had suggested that their use of language was a common flaw of graphic novels, the author of Text 2 emphasizes how many graphic novels are "beautifully written," and would therefore say that their use of language is exemplary, not that it is flawed. Choice C is incorrect because Text 1 doesn't claim that the story lines of graphic novels are generally relatively easy to understand; in addition, Text 2 argues that given their dependence on the interaction of image and text, the stories of graphic novels would be incomprehensible if their captions and dialogue were removed, not that the story lines of some graphic novels are more difficult to understand than Text 1 acknowledges. Choice D is incorrect because the author of Text 1 doesn't imply that graphic novels aren't well crafted, only that they use language too sparingly to fit the definition of "literature," and that their use of images to convey stories makes them more comparable to film than to literature. Even if the author of Text 1 had implied that most graphic novels aren't well crafted, Text 2 refers to the fact that many graphic novels are as beautifully written—that is, well crafted—as many standard novels; thus, it wouldn't be accurate to say that the author of Text 2 would agree with the author of Text 1 that most graphic novels aren't well crafted.

▼ 14 — D

Choice D is the best answer. The author of Text 2 states that Fontana's painting, which depicts a painting easel in the background, was made in 1577, eight years before Carracci's painting. Therefore, they might argue that Caracci was not "the first artist" to depict themself as a painter.

Choice A is incorrect. The texts don't support this choice. Neither text mentions the reputation or status of either Carracci or Fontana. Choice B is incorrect. The author of Text 2 does not comment on the intention or meaning of Fontana's self-depiction in *Self-Portrait at the Keyboard*. This choice also holds little connection to the underlined claim. Choice C is incorrect. The texts don't support this choice. The author of Text 2 does not suggest any inspirational relationship between Fontana and Carracci. The author of Text 2 is concerned with showing that Fontana's painting is the earliest example of an artist referring to painting in their self-portrait, but makes no mention of her influence on others.

▼ 15 — C

Choice C is the best answer because it presents the statement about music consumers that both authors would most likely agree with. The author of Text 1 indicates that because consumers are increasingly interested in purchasing experiences (the “growing ‘experiential economy’”), live music festivals are growing in size and variety and are being designed to stand out as special among many consumer options. The author of Text 2 indicates that as streaming service use increases and album sales decrease, live performances and music festival appearances are becoming more important to musicians as a source of revenue. Thus, both authors would most likely agree that changing consumer behaviors (greater interest in purchasing experiences and greater use of streaming services) are leading to changes in music-related businesses (music festivals).

Choice A is incorrect because the author of Text 1 makes no mention of streaming services and the author of Text 2 indicates only that the use of such services is rising, not that consumers prefer paying for streaming music over attending music festivals. Choice B is incorrect because the author of Text 1 indicates that the “growing ‘experiential economy’” is affecting the music industry but gives no indication that it is largely limited to that industry and the author of Text 2 makes no mention of consumers’ growing interest in purchasing experiences (focusing instead on musicians’ greater reliance on revenue from festivals and other live performances). Choice D is incorrect because the author of Text 1 makes no mention of music streaming platforms and the author of Text 2 suggests not that rising demand for live music festivals is driving demand for music streaming platforms, but rather that as streaming services become more widely used and reduce album sales, musicians become more dependent on festivals and other live performances for revenue.

▼ 16 — A

Choice A is the best answer. Text 1 is extremely positive about Strassburg’s team’s findings, calling the potential results "a clear win in the fight against the biodiversity and climate crises." Text 2 is not as positive, arguing that while the findings point to "potential benefits," we also need to consider the "potential effects on global food supplies."

Choice B is incorrect. This isn’t a difference between the two views. Text 1 does present the 15% number as enough to achieve meaningful results, but that’s not what Text 2 takes issue with: rather, Text 2 argues that we need to consider the effect that rewilding this much farmland would have on food supplies. Choice C is incorrect. This isn’t a difference between the two views. Neither text mentions the timeline for achieving the results described by Strassburg’s team. Choice D is incorrect. This isn’t a difference between the two views. Text 1 focuses on rewilding’s effects on both carbon emissions and biodiversity. Text 2 doesn’t

focus on rewilding's effect on carbon emissions at all. Instead, it focuses on a third factor: global food supplies.

▼ 17 — A

Choice A is the best answer. Text 1 states that Sykes felt Fletcher's contributions to the play were obvious because he had a distinct style in his other plays. Text 2 states that scholars generally agree "on the basis of style" that Fletcher wrote most of the three middle acts. Both texts imply that Fletcher's writing has a unique, readily identifiable style that can be used to distinguish his work from others.

Choice B is incorrect. While Text 1 refers to the women in Massinger plays, neither text compares the women of Fletcher's plays to the women of Massinger's plays. Text 2 doesn't mention Massinger at all. Choice C is incorrect. Text 1 states that Sykes disputed that Shakespeare coauthored the play, and implied that it was coauthored by Fletcher and Massinger instead. Sykes, therefore, would disagree that *The Two Noble Kinsmen* belongs in a Shakespeare compilation. Choice D is incorrect. Text 1 doesn't suggest that Massinger was inspired by Shakespeare, and Text 2 doesn't mention Massinger at all.

▼ 18 — D

Choice D is the best answer. Trever thinks that the "hyper-realistic portrayal of identifiable people" interpretation ignores the sculptors' imagination and creativity. We can infer that Trevor thinks the facial markings on the sculptures may not have represented real skin blemishes on real people.

Choice A is incorrect. The text gives us no reason to think that Trever would respond to the underlined interpretation in this way. Neither text compares the depictions of human faces to the depictions of plants or animals, so we have no basis to draw this conclusion. Choice B is incorrect. The text gives us no reason to think that Trever would respond to the underlined interpretation in this way. There's nothing in either text about multiple depictions representing the same person, so we have no basis to draw this conclusion. Choice C is incorrect. The text gives us no reason to think that Trever would respond to the underlined interpretation in this way. Neither text mentions the state of the vessels (damaged or intact), so we have no basis to draw this conclusion.

▼ 19 — B

Choice B is the best answer because it reflects how the author of Text 2 would most likely respond to the underlined claim about the Clovis people in Text 1. Text 1 explains that the

idea that the Clovis people were the first human inhabitants of North America has been overturned by the unearthing of stone tools in Chiquihuite Cave in Mexico. The tools were found in a layer of earth that is over 33,000 years old—much older than the Clovis people's arrival 13,000 years ago. The text ends with the claim that the tools reveal that humans lived in the cave long before the Clovis people reached the continent. Text 2, on the other hand, disputes the idea that the stone pieces are definitely tools. Text 2 states that the pieces are so roughly shaped that they may have simply naturally broken off from rocks and, moreover, that no other signs of human activity have been found in the cave. In other words, Text 2 argues that there is no proof yet that humans made the pieces as tools or were even present in the cave. Therefore, the author of Text 2 would most likely say that the claim that humans occupied Chiquihuite Cave long before the Clovis people reached North America rests on an assumption about the stone pieces—that they are human-made tools—that is not sufficiently supported by available evidence.

Choice A is incorrect because Text 1 doesn't claim that human inhabitants of Chiquihuite Cave and the Clovis people had any connection; the author of Text 1 focuses only on the timing of each group's presence in North America. Further, the author of Text 2 makes no mention of the Clovis people and indicates that it isn't clear yet that any human group did inhabit Chiquihuite Cave. Choice C is incorrect because nothing in Text 2 suggests that the author believes the stone pieces probably are human-made tools and will be confirmed as such by further analysis; instead, the author of Text 2 emphasizes the current lack of evidence of human activity in the cave. Choice D is incorrect because Text 2 focuses on the issue of characterizing the stone pieces as tools made by humans, not on the timing of any particular group's activity in North America; further, Text 1 seems to support the common belief that the Clovis people reached North America 13,000 years ago and challenges only the idea that they were the continent's first inhabitants. Therefore, there's no reason to think the author of Text 2 would say that the author of Text 1 overlooks evidence that the Clovis people were active as early as is commonly thought.

▼ 20 — D

Choice D is the best answer. According to Author 1, the "purists" argue that bluegrass should stick to its folk music roots. But Author 2 points out that this isn't how bluegrass emerged: it actually got its sound from a mix of folk, jazz, and blues.

Choice A is incorrect. There's nothing in Text 2 about what other genres the purists enjoy, so this inference about Author 2's views isn't supported. Choice B is incorrect. There's nothing in Text 2 about whether or how purists can enforce their preferences, so this inference about

Author 2's views isn't supported. Choice C is incorrect. There's nothing in Text 2 about the size of bluegrass's audience, so this inference about Author 2's views isn't supported.

▼ 21 — D

Choice D is the best answer. The author of Text 2 agrees with the author of Text 1 that bumblebees may engage in play and possibly experience some kind of positive emotional state. However, the author of Text 2 also qualifies this claim by stating that emotions in insects, if they do exist, are "likely very rudimentary."

Choice A is incorrect. While Text 2 states that other studies might indicate "negative emotional states" in bees, it does not contradict the findings from the Galpayage study—that the bees might have been having fun. Choice B is incorrect. The author of Text 2 does not mention or imply that any insects, including bumblebees, are capable of experiencing complex emotional states. The author of Text 2 states that if insects do feel emotions, those emotions are "likely very rudimentary." Choice C is incorrect. The author of Text 2 does not compare or contrast the behavior or emotions of insects and humans, and neither does the author of Text 1.

▼ 22 — C

Choice C is the best answer because it reflects how the author of Text 2 would respond to the claims in Text 1. Both texts address skills needed to produce digital art. Text 1 claims that digital art doesn't require the same amount of skill as creating physical art and that "the technology is doing most of the work." Text 2 states that digital art requires "knowing the fundamentals of art" and that many digital artists begin their work on paper and then transfer it to a digital format using "sophisticated software" and "a variety of colors and techniques." Therefore, the author of Text 2 would most likely insist that digital art requires artistic abilities even if it employs less traditional tools.

Choice A is incorrect because neither text discusses nondigital means of displaying art. Choice B is incorrect because the author of Text 2 doesn't address whether it's harder to use a tablet and stylus than it is to use paint and a brush. Text 2 does argue that digital art requires skills that aren't part of the traditional methods for producing art, but the text doesn't address relative difficulty. Choice D is incorrect because the author of Text 2 states that digital artists still need to know "the fundamentals of art" and that many digital artists begin their work by drafting on paper before transferring the work to a digital format.

▼ 23 — C

Choice C is the best answer because it presents the statement about the use of painted frames in Impressionist painting that both authors would be most likely to agree with. Text 1 discusses painter Edgar Degas's insistence that his works remain in their original painted frames, which contrasted with the gold frames that were typical of the Paris art scene at the time. The text then argues that the preference of Degas and other French Impressionist painters for colorful frames can likely be attributed to their desire "to distinguish themselves from what was considered conventional at the time." Text 2 also notes that Impressionist painters "placed their works in painted frames" but argues that they probably did so for a purely aesthetic reason: to ensure that "the frame's color...would harmonize with the colors or subjects in a painting." Though differing on Impressionist painters' rationale for using painted frames, the authors of both texts would agree that many Impressionist painters were intentional about the frames they selected for their works.

Choice A is incorrect because neither text suggests that gold frames were considered desirable by those purchasing Impressionist works. Indeed, it can be inferred from the fact that Impressionist painters used painted frames that those who purchased those works wouldn't have had a strong preference for gold frames. Choice B is incorrect because neither text suggests that Impressionist painters chose colors for their paintings based on planned frame colors. Indeed, Text 2 states that frame colors were chosen to "harmonize with the colors or subjects in a painting," implying that the color scheme of paintings predated and took precedence over the choice of the colors of frames. Choice D is incorrect because Text 1 presents Degas's preference for painted frames as being typical of Impressionist painters' attitudes toward the framing of their works. Moreover, although Text 2 doesn't specifically discuss Degas, it concurs with Text 1's assertion that these painters preferred painted frames. Thus, both texts position painted frames as a hallmark of French Impressionist painting, not as a deviation from it.

▼ 24 — D

Choice D is the best answer because it reflects how the author of Text 2 would most likely respond to what the researchers mentioned in Text 1 contend. Text 1 discusses the lack of knowledge of how plate tectonics on Earth began. Text 1 also mentions researchers who contend that movements of tectonic plates began around 3 billion years ago. As support for this assertion, these researchers cite computer models (which are simulations, not empirical evidence) of the temperature in Earth's mantle that show that at that time, the mantle would have been sufficiently molten for plates to move. However, the author of Text 2 asserts that empirical evidence from the geological record is necessary to make plausible claims about when tectonic movement began. Text 2 mentions an analysis performed by Wriju Chowdhury

and his team of the geochemistry of zircon crystals (which would constitute empirical evidence). Chowdhury and his team argue, based on this analysis, that tectonic plates may have begun to move as early as 4.2 billion years ago. Therefore, since the author of Text 2 would consider Chowdhury et al.'s empirical evidence to be more conclusive than the computer models cited in Text 1, the author of Text 2 would most likely assert that a more definitive form of evidence than the computer models suggests a different timeline for the onset of plate tectonics on Earth.

Choice A is incorrect because the author of Text 2 makes no claims about the temperature of Earth's mantle and therefore wouldn't argue that the temperature of Earth's mantle 3 billion years ago was insufficient to allow tectonic movement. Choice B is incorrect because the author of Text 2 claims that empirical evidence is needed to fix the earliest date of tectonic movement. Computer models are simulations, not empirical evidence, so the author of Text 2 wouldn't distinguish between different kinds of computer models but would instead argue that no computer models can reliably predict the onset of plate tectonics. Choice C is incorrect because the author of Text 2 wouldn't consider any computer model to be able to provide evidence to support a plausible claim about tectonic movement, no matter how much such models were improved. The author of Text 2 would only accept empirical evidence.

▼ 25 — A

Choice A is the best answer. Brierley et al.'s research directly challenges Wright's claim that pastoralism turned the Sahara into a desert, suggesting that, in a Sahara that turned arid 500 years earlier than previously thought, pastoral practices may have actually "preserved vegetation" rather than depleting it.

Choice B is incorrect. Brierley et al.'s research actually disputes the idea that any Neolithic peoples' behaviors, including pastoralism, could have contributed to the Sahara's changing climate. In fact, their research implies that the Neolithic peoples' practices did not "exacerbate aridity" (i.e., make things worse), but may have slowed environmental changes. Choice C is incorrect. Brierley et al.'s research does not acknowledge that pastoralism can have deleterious (i.e., negative) effects on a region's vegetation and climate. It only describes one possible beneficial effect: preserving vegetation through practices like selective grazing. Choice D is incorrect. Brierley et al.'s research does not call for more research into factors that likely contributed to the desertification of the Sahara region.

▼ 26 — B

Choice B is the best answer. Text 1 introduces Wang and colleagues' study and its surprising results, and then mentions Miller and Simpson's hypothesis as a possible way to explain them. Text 2, however, challenges Miller and Simpson's hypothesis by pointing out the difficulties of preserving mammoth carcasses on the surface for thousands of years: "scavengers and weathering" are the additional details that complicate the Miller/Simpson hypothesis.

Choice A is incorrect. Neither text compares two different approaches for studying mammoth extinction. Text 1 describes one study and one hypothesis pertaining to it. Text 2 critiques that hypothesis. Choice C is incorrect. Text 1 does not describe a critique of Wang and colleagues' methodology, but rather an interpretation of their results by Miller and Simpson. Text 2 does not offer additional details showing that methodology to be sound, but rather casts doubt on the Miller/Simpson explanation. Choice D is incorrect. Both components mentioned here (the new "undermining" research and the theory for reconciling this discovery) are contained in Text 1. Text 2 then shows how the attempt to reconcile the standard view and new research is flawed, and still fails to explain the discrepancy.

▼ 27 — C

Choice C is the best answer because it characterizes how Maddux would most likely respond to the conclusion Sharif reached after her research. Text 1 describes Sharif's study of the benefits of free time, saying that the reported sense of satisfaction plateaued at two hours per day and began to decline at five hours per day. Further research led Sharif to conclude that time spent doing tasks she defines as unproductive, such as watching TV or playing games, correlated with a drop in life satisfaction. However, in Text 2 Maddux says that there is no objective definition of what constitutes productive behavior, giving the example that reading a book might be considered productive by some but unproductive by others. It can be inferred that Maddux would also assert that whether watching TV or playing games is productive or unproductive is a matter of subjective judgment. Thus, Maddux would most likely caution against making an overly broad assumption, as there is no clear consensus in distinguishing between productive and unproductive activities.

Choice A is incorrect because Maddux asserts that individuals have unique needs for life satisfaction: some may want to spend that time productively, others unproductively, and what counts as productive is subjective. Therefore, Maddux would likely not consider it universally true that free time is more likely to enhance life satisfaction when it is spent productively. Choice B is incorrect because the study described in Text 1 concerns whether free time contributes to life satisfaction, not whether productivity contributes to life

satisfaction. The dip in life satisfaction that Sharif claims to observe in Text 1 happens only after five hours, and mainly if the time is spent unproductively—that is, two hours of free time spent productively might increase life satisfaction just as much as two hours spent unproductively. Choice D is incorrect because Maddux holds the opinion that whether an activity is productive or unproductive is subjective and depends on the individual; therefore, he would most likely claim that watching TV or playing games might be productive for some and unproductive for others.

▼ 28 — B

Choice B is the best answer. Siraj's hypothesis is that the Chicxulub impactor was a long-period comet. But Artemieva points to the iridium found in the crater and in "geological layers that were deposited worldwide after the impact" as evidence that it was actually an asteroid, not a long-period comet.

Choice A is incorrect. We can't infer that this is how Artemieva would respond to Siraj's hypothesis. Text 2 never discusses whether Wild 2 is representative of long-period comets in general. Rather, Text 2 presents Artemieva's argument that the Chicxulub impactor was an asteroid, not a long-term comet. Choice C is incorrect. We can't infer that this is how Artemieva would respond to Siraj's hypothesis. Siraj's hypothesis doesn't make this connection: rather, Siraj hypothesizes that the Chicxulub impactor was a long-term comet. Choice D is incorrect. We can't infer that this is how Artemieva would respond to Siraj's hypothesis. "Soil samples from sites distant from the Chicxulub crater" is too vague. Only soil samples from sites that are connected to the impact in some way are involved in either hypothesis.

▼ 29 — B

Choice B is the best answer. The author of Text 2 directly contradicts Bremner's claim that Appia lacked technical expertise by stating that Appia was "not an amateur in the practice of lighting." His experience as a lighting specialist's apprentice would have, the author of Text 2 argues, allowed Appia to "[develop] his understanding of what was possible" with the elements of theatrical design.

Choice A is incorrect. Neither text describes how other lighting technicians responded to Appia's ideas. Furthermore, this claim isn't relevant to Bremner's evaluation of Appia's technical expertise. Choice C is incorrect. Neither text mentions anything about the opinions of theater practitioners who worked with Appia, so this answer choice does not relate to the claim about Appia's level of technical expertise made by Bremner in Text 1. Choice D is

incorrect. Neither text mentions anything about Appia's familiarity with or ignorance of the use of music and sound in theater. Both focus on his expertise (or lack thereof) in lighting.

▼ 30 — A

Choice A is the best answer. Text 2 describes how the Svalbard polar bears have adapted to the loss of sea ice by diversifying their diet and feeding on reindeer and seabird eggs, resulting in a "stable and well nourished" population despite environmental challenges. This counters the underlined claim that polar bears facing a loss of sea ice are at "great risk of extinction" by the end of the century.

Choice B is incorrect. Text 2 does not challenge the fact that sea ice is rapidly declining in the Arctic due to warming ocean temperatures. In fact, it states that the Svalbard polar bears have faced "rapidly declining sea ice in recent years." Choice C is incorrect. The claim in Text 1 is specific to polar bear populations affected by the loss of seal hunting habitats, so unaffected populations are irrelevant to the claim. Also, Text 2 doesn't mention any polar bear populations that haven't yet been affected by loss of seal hunting habitats. It focuses on a population that has been affected by sea-ice loss but has managed to survive and thrive nevertheless. Choice D is incorrect. Text 2 doesn't imply that polar bears rely on a single seal-hunting strategy. In fact, the researcher in Text 2 would say that Text 1 fails to account for polar bears' ability to develop other hunting strategies and food sources.

▼ 31 — A

Choice A is the best answer because it reflects what the paleontologists in Text 2 would most likely say about what the researchers in Text 1 initially thought. Text 1 focuses on the discovery of a strange fossil consisting of the skull of the extinct species *Oculudentavis khaungraae*. According to Text 1, the fossil has features that appear to be avian, or related to birds, which led researchers to initially think that the fossil might be a very small avian dinosaur. Text 2 begins by noting the discovery of a second fossil similar to the one discussed in Text 1, then explains that based on detailed studies of both fossils, paleontologists think that the two creatures were probably unusual lizards, even though the skulls appeared avian at first. This suggests that the paleontologists in Text 2 recognize that the fossils do indeed look like they could be related to birds. For this reason, the paleontologists in Text 2 would most likely say that the initial thought of the researchers in Text 1—that the fossil was avian—is understandable, even if the fossil is probably not avian but rather is from a lizard.

Choice B is incorrect because Text 2 indicates that the fossils initially looked avian, so the paleontologists described in Text 2 wouldn't be confused by the researchers in Text 1 initially thinking that *O. khaungraae* might be related to birds. The paleontologists would find that initial thought understandable, not confusing. Choice C is incorrect because Text 1 never mentions lizards, so it wouldn't make sense for the paleontologists in Text 2 to say that the researchers in Text 1 mistakenly assumed that *O. khaungraae* must be a lizard. Choice D is incorrect. Although the paleontologists in Text 2 might agree that the initial thought of the researchers in Text 1 was reasonable, nothing in Text 2 suggests that the two skulls were shaped differently.

▼ 32 — D

Choice D is the best answer because it reflects how the author of Text 2 would most likely respond to the underlined claim in Text 1. Text 1 begins by noting the success of *The Nutcracker* but then claims that the ballet is "stuck in the past" and should "no longer be produced." Text 2 begins by conceding that *The Nutcracker* is indeed outdated but argues that it should continue to be performed, states that the show can be updated to include more contemporary dance styles, and provides an example of one such modernized version, *Hot Chocolate Nutcracker*. Hence, the author of Text 2 would most likely respond to the underlined claim in Text 1 by suggesting that dance companies should consider offering revised versions of *The Nutcracker* instead of completely rejecting the show.

Choice A is incorrect because the author of Text 2 advocates for using creative ways to update *The Nutcracker* and therefore wouldn't respond to the underlined claim by rejecting the suggestion that contemporary audiences would enjoy an updated version. Choice B is incorrect because although the authors of both texts claim that *The Nutcracker* is outdated, neither text suggests that contemporary audiences have largely stopped attending productions of the show. On the contrary, Text 2 states that *The Nutcracker* is a holiday favorite and generates substantial income for some dance companies. Choice C is incorrect because although Text 2 provides an example of a contemporized version of *The Nutcracker*, the text doesn't suggest that offering modernized versions is a way to increase income for most dance companies. Rather, the author of Text 2 suggests that offering modernized versions is a way to make the ballet discussed in Text 1 feel less outdated.

▼ 33 — B

Choice B is the best answer because it represents how the researchers in Text 2 would most likely respond to the underlined claim in Text 1. Text 1 begins by asserting that the

unintended transfer of feelings from one person to another, known as emotional contagion, seems to rely on both people being physically present and able to observe body language. Text 1 then references research that supports this assertion. Text 2 describes an experiment conducted by the researchers Yang and Ferrara in which they found evidence of emotional contagion in the absence of physical interaction, namely through text-based interactions on social media. The researchers in Text 2 wouldn't completely agree with what is asserted in the underlined portion of Text 1 (that emotional contagion seems to require physical proximity), because their study, which used a social media networking service, found that physical interaction isn't the only way that emotional contagion can take place. Thus, the researchers in Text 2 would most likely respond to the underlined claim in Text 1 by stating that it reflects an incomplete view of emotional contagion, because the phenomenon can occur without an in-person interaction.

Choice A is incorrect. Although the researchers in Text 2 would likely agree that the underlined statement in Text 1 perpetuates a flawed conclusion that emotional contagion requires physical interaction, Text 2 doesn't address what the researchers thought about smiling as a sign of emotional contagion. Choice C is incorrect because the researchers in Text 2 wouldn't say that the underlined claim in Text 1 is fairly persuasive. According to Text 2, the researchers conducted a study that found emotional contagion didn't require physical interaction, because they found evidence of it in text-based online interactions. Choice D is incorrect because neither of the texts claim that emotional contagion primarily occurs when a person is exposed to negativity. Instead, Text 1 claims that physical interaction is required for emotional contagion to occur, and Text 2 describes a study that suggests emotional contagion can occur in text-based online interactions.

▼ 34 — A

Choice A is the best answer because it reflects how Tsai et al. would most likely respond to Madhusudhan et al.'s identification of K2-18 b as a hycean candidate. Text 1 establishes that the habitable zone (HZ) for potential hycean planets, which are typified by abundant liquid water and hydrogen-rich atmospheres, represents "the distance from a star that allows a planet to retain liquid water on its surface" and is estimated to begin at about 1 astronomical unit (AU). Based on this characterization of the HZ, Madhusudhan et al. identified K2-18 b as a hycean candidate whose location falls on the "inner edge" of the HZ —implying that its distance from its star is about 1 AU. However, Text 2 presents Tsai et al.'s claim that the same hydrogen-rich atmospheres that typify K2-18 b and other hycean candidates "admit wavelengths of light that cause elevated surface temperatures and increased water evaporation," phenomena that would be exacerbated by proximity to their

host stars. Tsai et al. instead placed the inner edge of the HZ "as far out as 3.85 AU," implying that hycean candidates at lesser distances from their stars would be unlikely to maintain liquid oceans because of elevated surface temperatures and subsequent water evaporation. According to Tsai et al.'s HZ estimate, K2-18 b—at roughly 1 AU—would be too close to its star to retain liquid water. Therefore, based on the details in the texts, Tsai et al. would most likely respond that the very atmospheric composition that defines K2-18 b as a hycean candidate suggests that it is unlikely to harbor liquid water on its surface.

Choice B is incorrect. In contrast to the suggestion that Madhusudhan et al.'s estimates of the surface temperature of hycean candidates are "likely too high," Tsai et al.'s findings suggest the opposite: earlier assessments of the HZ didn't fully account for the warming effect of wavelengths of light admitted by these planets' hydrogen-rich atmospheres, which is why Tsai et al. placed the edge of the HZ farther out. The information in Text 2 therefore suggests that Tsai et al. would view Madhusudhan et al.'s temperature estimates as too low rather than as too high. Choice C is incorrect because neither text discusses other types of planets with hydrogen-rich atmospheres or compares them to hycean candidates. It therefore doesn't follow from the information in the texts that Tsai et al. would observe that most other hydrogen-rich planets are likely within the HZ. Text 2 only indicates that the HZ for hycean candidates begins at about 3.85 AU and that K2-18 b therefore isn't likely to be within the HZ, not that other planets with hydrogen-rich atmospheres are mostly located within the HZ. Choice D is incorrect because it mischaracterizes Tsai et al.'s findings. Rather than indicating that K2-18 b and other hycean candidates are "too far from the stars they orbit," Tsai et al.'s findings suggest the opposite problem. Because these planets' hydrogen-rich atmospheres admit wavelengths of light that cause elevated temperatures and water evaporation at distances of less than 3.85 AU, Tsai et al. would be more likely to argue that K2-18 b (at a distance of about 1 AU) and planets like it are too close to their stars, not too far from them. Moreover, Text 2 doesn't suggest anything about hycean candidates more generally being unable to support life, only that hycean candidates at distances less than 3.85 AU from their stars, like K2-18 b, likely don't have the liquid water needed to sustain life. Presumably, hycean candidates that are within the HZ described by Tsai et al. could harbor liquid oceans necessary for supporting life.

▼ 35 — B

Choice B is the best answer because it reflects how the author of Text 1 would most likely respond to the study findings described in Text 2. The author of Text 2 discusses a study by Florian Humpenöder and his colleagues that found that deforestation would be reduced by half over the next thirty years if 20% of the beef consumed worldwide were replaced with

mycoprotein. The author of Text 1 points out that mycoprotein is not widely available because of its high production cost, but goes on to note that this problem could be addressed by the creation of a cheaper substrate to feed mycoprotein. This suggests that the author of Text 1 would assert that the development of a less expensive mycoprotein substrate would contribute to the reduction in deforestation described in the study findings discussed in Text 2: if reducing the cost of mycoprotein increases people's access to it, then mycoprotein may be able to replace beef in more people's diets, thereby reducing the deforestation associated with beef production.

Choice A is incorrect because the author of Text 1 indicates that the environmental impact of mycoprotein production is close to that of chicken or pork production, so there is no reason to think that the author would assert that replacing chicken or pork with mycoprotein would be environmentally beneficial: such a replacement would not lessen the total environmental impact of food manufacture. Additionally, the specific issue of agricultural water consumption is never mentioned in Text 1, so there is no evidence indicating what the author of Text 1 would say about that issue. Choice C is incorrect. Although Text 1 does compare the environmental effects of producing mycoprotein to those of producing chicken or pork, nothing in Text 1 suggests that the author believes that people are more likely to replace chicken or pork with mycoprotein than they are to replace beef with mycoprotein. Choice D is incorrect because Text 1 makes no mention of countries' varying contributions to deforestation, so there is no evidence that the author of Text 1 would respond to the finding described in Text 2 by saying that some countries will have to replace more than 20% of their beef consumption with mycoprotein.

▼ 36 — B

Choice B is the best answer because Anbar et al. and Slotznick et al. would most likely disagree about whether the molybdenum (Mo) increase indicates atmospheric oxygen levels specifically at 2.5 Ga. Anbar et al. conclude that the Mo increase they found "at a point corresponding to roughly 2.5 billion years ago" means that "atmospheric oxygen briefly increased 2.5 Ga, then returned to its earlier negligible level," directly linking the timing of the Mo increase to contemporaneous atmospheric oxygen levels. In contrast, Slotznick et al. discovered volcanic debris and microfractures in the rock core and "assert that fluid could have reached the debris through the microfractures and initiated oxidative weathering long after debris deposition." If, as Slotznick asserts, the Mo detected at the 2.5 Ga portion could have been deposited there much later through weathering processes, then the Mo increase wouldn't necessarily indicate atmospheric oxygen levels at 2.5 Ga specifically. Thus, Anbar et al. and Slotznick et al. disagree on whether the increase in Mo in the portion of the rock

core corresponding to 2.5 Ga is indicative of an increase in atmospheric oxygen dating to the same time.

Choice A is incorrect because neither research team's findings directly address atmospheric oxygen levels before 2.5 Ga. Anbar et al. conclude that oxygen "returned to its earlier negligible level" after 2.5 Ga, implying low pre–2.5 Ga levels, while Slotznick et al. focus on explaining the Mo increase through later weathering processes rather than making claims about earlier atmospheric conditions. Choice C is incorrect because both research teams would likely agree that the Mo increase is attributable to oxidative weathering. Anbar et al. state that "Mo is released mainly through oxidative weathering of minerals," and Slotznick et al. also reference "oxidative weathering" as the process that released Mo from the volcanic debris. Their disagreement concerns the timing of this weathering, not whether oxidative weathering is responsible. Choice D is incorrect because Slotznick et al. don't suggest that bulk chemical analysis created a false impression about the presence of increased Mo. They acknowledge that the Mo increase exists but offer a different explanation for its timing and source. They critique bulk analysis for occluding "contextual details" that would require another kind of analysis to uncover, not for producing inaccurate measurements of Mo levels.

▼ 37 — B

Choice B is the best answer because it reflects how the author of Text 2 would most likely respond to Text 1 based on the information provided. Text 1 discusses the discovery of a regeneration-linked gene, EGR, in both three-banded panther worms (which are capable of full regeneration) and humans (who have relatively limited regeneration abilities). Text 1 characterizes this discovery as "especially promising" and a sign of "exciting progress" in understanding human regeneration. The author of Text 2, on the other hand, focuses on the fact that the team that reported the EGR finding pointed out that while EGR's function in humans isn't yet known, it's likely very different from its function in panther worms. Therefore, the author of Text 2 would most likely say that Text 1's enthusiasm about the EGR discovery is overly optimistic given Srivastava's team's observations about EGR in humans.

Choice A is incorrect because the author of Text 2 explains that Srivastava and her team explicitly reported that they haven't yet identified how EGR functions in humans; therefore, the author of Text 2 wouldn't say that Text 1's excitement is reasonable for the stated reason. Instead, the author of Text 2 would likely characterize Text 1's excitement as premature and overly optimistic. Choice C is incorrect because Text 1 does treat Srivastava's

team's findings with enthusiasm; it describes the discovery of EGR in both three-banded panther worms and humans as promising and exciting. It would be illogical for the author of Text 2 to say that because most others treat the discovery with enthusiasm, Text 1's enthusiastic characterization of the discovery is unexpected. Choice D is incorrect because Text 1 isn't at all dismissive of Srivastava's team's findings; instead, Text 1 is optimistic about the EGR discovery, characterizing it as promising and exciting. There's nothing in Text 2 to suggest that the author of Text 2 would say that Text 1's praise for the discovery is dismissive, or disdainful.

▼ 38 — C

Choice C is the best answer because it reflects how the author of Text 2 would most likely respond to the assessment of *Orlando* in Text 1. Both authors agree that *Orlando* is unusual for Woolf: Text 1 states that the novel examines its characters' psychologies more superficially than Woolf's other novels do, and Text 2 describes it as being lighter in tone. However, while Text 1 calls *Orlando* an "oddity" and mentions that Woolf "began it as a joke," Text 2 asserts that *Orlando* engages the same themes as Woolf's other great novels. Hence, the author of Text 2 would most likely accept that *Orlando* differs from Woolf's other novels but would also insist on its importance in the context of Woolf's work as a writer.

Choice A is incorrect. Text 2 does suggest that the humor in *Orlando* is effective. However, there's nothing in Text 2 to suggest that the author would agree that Woolf's talents were best suited to serious novels. Rather, the author of Text 2 compares *Orlando* favorably to other novels by Woolf that are implied to be darker in tone. Choice B is incorrect because the author of Text 2 does not indicate that *Orlando* is less impressive than Woolf's other novels, but instead points out that it engages the same themes as other novels by Woolf that are considered classics. Choice D is incorrect because there's nothing in Text 1 or Text 2 to suggest that readers have generally ignored *Orlando* because of its reputation.

▼ 39 — B

Choice B is the best answer. Author 1 describes the puzzle that physicists still can't solve: at a microscopic level, the "laws of physics" suggest that we should be able to reverse processes that are not reversible at a macroscopic level (and, maybe, turn back time!). The experiment confirmed that those processes are not reversible even on the microscopic level, but it didn't explain why. This supports Author 1's point that physicists still don't fully understand how things work at a microscopic level—maybe the laws need to be revised.

Choice A is incorrect. We can't infer that the author of Text 1 would respond this way to the experiment. Text 2 does name two of the physicists involved in the experiment, but it never suggests that they disagree on anything. Choice C is incorrect. This is the opposite of what the experiment suggests. The experiment confirmed that the macroscopic-level law ("these things can't be reversed—like time") was still true on the microscopic level—meaning it supports the current understanding of physics at a macroscopic level. Choice D is incorrect. We can't infer that the author of Text 1 would respond this way to the experiment. Neither text makes this distinction between laboratory findings and the way the universe works in general.

▼ 40 — D

Choice D is the best answer. Lacadena's theory is that Nahuatl script symbols signified syllables, but the consensus described in Text 2 is that they can signify either symbols or full words, depending on the context. So the author of Text 2 would likely consider Lacadena's theory too simplistic: it's missing the importance of the context in determining the meaning of a symbol.

Choice A is incorrect. This conflicts with Text 1's description of Lacadena's theory. Lacadena's theory is that Nahuatl script symbols signified syllables. Choice B is incorrect. This conflicts with Text 1's description of Lacadena's theory. Text 1 states that Lacadena's theory differed from what earlier scholars believed. Choice C is incorrect. We can't infer that this is how the author of Text 2 would characterize Lacadena's theory. Neither text mentions how or even if the script changed over time.

▼ 41 — B

Choice B is the best answer. Both texts are critical of *The Guns of August*, but for different reasons: the author of Text 1 argues that Tuchman missed an important factor leading up to the war because she didn't consult secondary sources, and the author of Text 2 argues that Tuchman's main thesis is "reductive," which is a close synonym for "overly simplistic."

Choice A is incorrect. This doesn't accurately describe the difference. This choice's summary of Text 1 is accurate, but Text 2 never says that Tuchman's most interesting claims result from her original research. Choice C is incorrect. This doesn't accurately describe the difference. Text 1 never says that *The Guns of August* is worthwhile to read despite its research weaknesses. Text 2 does call out a weakness of Tuchman's interpretation of events, but it also praises her analysis of primary sources. Choice D is incorrect. This doesn't accurately describe the difference. Text 1 actually says that Tuchman "fails to

address" the influence of events in Eastern Europe, while Text 2 says that Tuchman's thesis was that European powers (not Eastern European leaders) were committed to military plans.

▼ 42 — A

Choice A is the best answer. The researchers in Text 2 recognize that acquiring information is a powerful motivator, but showed that this motivation can still be affected by other factors, like whether or not the information is expected to be useful or not. This suggests that other desires may play a part in driving people to acquire information.

Choice B is incorrect. The consensus view in Text 1 is that people acquire information regardless of whether they think they can use it later. Dubey and colleagues acknowledge this fact (so they don't claim people seek out information "only" because it might be useful later). Choice C is incorrect. This choice misreads the results of Dubey and colleagues' study in Text 2. Neither text discusses the difficulty of determining the motivation for information-seeking. Choice D is incorrect. This choice contradicts Text 2, which starts with Dubey and colleagues "acknowledging that acquiring information is a powerful motivator" (i.e., agreeing that curiosity explains the seeking of apparently purposeless information). The research in Text 2 simply suggests that more than just curiosity can motivate information-seeking behavior when the information has a purpose.

▼ 43 — D

Choice D is the best answer because it reflects how the author of Text 2 would most likely respond to the researchers' perspective in Text 1 on the behavior of the magpies without trackers. According to Text 1, Dominique Potvin and colleagues observed magpies without trackers pecking at a tracker on another magpie until the device fell off. The researchers suggested that the birds might have been attempting to help the other bird, with no benefit to themselves. Text 2 generally discusses scenarios in which animals have been observed removing trackers from each other. The text cautions that it shouldn't be assumed that these animals are helping one another deliberately, since they might simply be pecking at trackers out of curiosity, causing them to fall off eventually. Therefore, the author of Text 2 would most likely respond to Potvin and colleagues' perspective in Text 1 by saying that the behavior of the magpies without trackers could be adequately explained without suggesting that they were attempting to assist the other magpie.

Choice A is incorrect because Text 2 never discusses the novelty, or the newness and unusual quality, of the captive settings in which animals have been observed to remove trackers from other animals, nor does it suggest that such novelty might account for this

behavior. Instead, the text suggests that it's the novelty of the tracking equipment itself that might cause the behavior: interested in the trackers because they're unusual, animals might paw or peck at them until they fall off. Choice B is incorrect because Text 2 never suggests that when animals remove trackers from other animals, they do so because they wish to obtain the trackers for themselves. Instead, Text 2 argues that animals paw or peck at trackers because they are merely curious about them. Choice C is incorrect because Text 2 doesn't argue that when captured animals are observed removing trackers from each other, their behavior should be regarded as selfless only if all of them participate in it. Instead, the text argues that the behavior may not be selfless at all and may instead be attributed to animals' curiosity about the new and unusual trackers.

▼ 44 — B

Choice B is the best answer because it describes how Hull's team would most likely respond to the argument in the underlined portion of Text 1, which asserts that volcanic activity in the Deccan Traps range led to changes in the climate and caused the K-Pg mass extinction event. According to Text 2, although Hull's team found that activity in the Deccan Traps did indeed alter the climate before the K-Pg event, the team determined that the climate had returned to normal before mass extinctions began. This finding and the observation that the K-Pg extinctions closely align with the Chicxulub asteroid impact suggest that Hull's team would likely dispute the claim in the underlined portion of Text 1 and say that the climate changes caused by the Deccan Traps activity were not the main cause of the extinctions.

Choice A is incorrect because Text 2 describes how Hull's team found that the climate had recovered from the changes brought about by the Deccan Traps activity before the K-Pg event occurred, which suggests that Hull's team would disagree that the Deccan Traps activity caused the K-Pg event. Additionally, the claim in the underlined portion of Text 1 says nothing about how the Chicxulub impact changed the climate, so while Hull's team might believe that the impact did in fact change the climate, they could not be said to agree with the claim in Text 1 on this point. Choice C is incorrect because there is no indication in either text that any scientists assume that the Chicxulub impact caused the Deccan Traps activity, so there is no reason to conclude that Hull's team would question why the scientists referred to in Text 1 make such an assumption. Choice D is incorrect because Text 2 describes how Hull's team found that the climate had recovered from the changes brought about by the Deccan Traps activity before the K-Pg event occurred, which suggests that Hull's team would say that the Deccan Traps activity had a less enduring effect on global conditions than the scientists referenced in Text 1 believe, not that the effect on global conditions was more significant than those scientists claim.

▼ 45 — A

Choice A is the best answer because it provides a statement about the description of the first showing of *Arrival of the Train* in Text 1 that, based on the texts, the author of Text 2 would most likely agree with. Text 1 indicates that members of the audience, unaccustomed to the new medium of film and believing that they were looking at a real oncoming train, allegedly reacted to the film with alarm. Text 1 then goes on to treat this anecdote as a factual account of the film's first showing, interpreting it as a moment that marked a "major cultural shift." In contrast, the author of Text 2 indicates that though the story of the film's first showing has become "canonical," or widely accepted, there is no contemporary evidence to support the idea that the audience reacted as Text 1 describes. Text 2 goes on to explain that this factually questionable description likely persists because it functions as a "founding myth" that reinforces a widespread belief in the profoundly transformative nature of the invention of film. This indicates that the author of Text 2 would likely see the description in Text 1 as motivated primarily by cultural perceptions about film's significance rather than by documented historical facts.

Choice B is incorrect because the author of Text 2 doesn't suggest that film historians regard the view about film's transformative nature as naïve. On the contrary, Text 2 states that the story of the first showing of *Arrival of the Train* has become "canonical, even among film historians," indicating that historians broadly accept this narrative as a compelling illustration of film's impact, not that they regard either the narrative or the views it conveys about the transformative nature of film as naïve. Text 2 refers to a "(naïve) 'before'" in cultural history, but this is describing how the myth itself characterizes pre-film audiences, not how historians regard views about the transformative nature of film. Choice C is incorrect. While the author of Text 2 does indicate that the story of the audience's reaction to *Arrival of the Train* described in Text 1 is a myth that lacks evidence, the text doesn't suggest that the story reflects the fact that film historians believe themselves to be more sophisticated than modern audiences are. Rather, Text 2 suggests that the story persists because of a collective cultural belief, which historians share, in the profound impact of the invention of film. Moreover, the "naïve" versus "sophisticated" distinction mentioned in Text 2 refers to how the myth characterizes audiences before and after the invention of film; it doesn't characterize modern audiences versus film historians. Choice D is incorrect. Although the author of Text 2 would agree that the description of the first showing of *Arrival of the Train* in Text 1 reflects a misconception, the author wouldn't agree that widespread belief in the misconception can be attributed to the fact that it accurately captures early audiences' actual sense of alarm. In fact, the misconception identified by the author of Text

2 concerns the accuracy of the audience's alleged reaction; the author questions whether early audiences were alarmed at all, stating there is "no contemporary evidence" that they reacted in this way. According to Text 2, the description is widely believed not because it accurately captures historical reactions but because it serves as a "founding myth" that supports a belief in film's transformative cultural impact.

▼ 46 — D

Choice D is the best answer. The author of Text 2 acknowledges that nanohybrids may be more toxic than their constituent parts, but also provides an example of a nanohybrid that has reduced toxicity compared to its components: silicon dioxide and zinc oxide together have all the benefits of zinc oxide nanoparticles without any of the DNA harm zinc oxide has on its own.

Choice A is incorrect. While the author of Text 2 gives an example of a nanohybrid that isn't as toxic as its constituent parts, they don't argue that the benefit outweighs the risk. They merely argue that "the effects of nanomaterial conjugation vary by case." Choice B is incorrect. The author of Text 2 states that the effects of nanomaterial conjugation "vary by case," and that the attention that their potential toxicity has drawn is warranted. If the situation in Text 1 weren't representative, then there would be less attention to the potential danger of these materials. Furthermore, neither passage suggests that researchers had expected that they could predict the effects of nanomaterial conjugation. Choice C is incorrect. The author of Text 2 agrees that the potential toxicity of nanohybrids "has drawn deserved attention," so they aren't denying the problem.

▼ 47 — D

Choice D is the best answer because the critics mentioned in Text 2 would argue that negative reactions to controversial public art are not solely the result of the nature of the art itself. The claim in Text 1 suggests that public artworks tend to provoke backlash when they are not "aesthetically and conceptually bland." This implies that the content of public art alone can cause backlash. However, the critics in Text 2 offer a more nuanced explanation. They argue that norm-defying pieces of public art that are not "effectively integrated within their surroundings" are more likely to be judged harshly by the public. They also imply that a museum provides a context that prepares viewers to expect challenging art, while public environments that serve other purposes often do not. This indicates that the critics in Text 2 would contend that factors beyond the attributes of the art, like environment and presentation, play a significant role in how public art is received.

Choice A is incorrect because the critics in Text 2 do not argue that unconventionality is unrelated to public disagreement about a public artwork's merits. Rather, they acknowledge that norm-defying pieces do face unfavorable reactions, but they attribute such reactions to contextual factors like poor integration with the environment rather than dismissing the role of unconventionality entirely. Choice B is incorrect because the critics in Text 2 do not advocate for restricting public art to universally appealing works. Instead, they argue that better integration with the surroundings and situating the work in appropriate contexts could help norm-defying art be better received by passersby. Choice C is incorrect because the critics in Text 2 do not address whether civic leaders and community members are easily satisfied by norm-reinforcing art. The critics in Text 2 instead argue that installation and integration with the surrounding environment factor into how norm-defying art is received by the general public, rather than disputing how people respond to conventional art.

▼ 48 — B

Choice B is the best answer because it correctly applies the model presented in Text 1 to explain the different outcomes in the two tanks described in Text 2. Text 1 begins by explaining that fertile female teleost fish will sometimes become fertile males through protogyny. The model, or explanation, of protogyny advanced in Text 1 holds that among female teleost fish, size doesn't confer any reproductive advantage, but among male teleost fish, "only individuals comparatively large enough to defend territory reproduce"—in other words, there is a direct relationship between relative body size and reproductive success, but only among male fish. Text 1 concludes by saying that, according to this model, individuals can maximize their reproductive success by "staying female when small" (when size has no relevance to reproduction) and only becoming male when they reach a certain size threshold by becoming large enough relative to other male fish to be able to defend territory. In sum, according to the model, whether protogyny is advantageous depends on a female's body size relative to the males currently present. Text 2 describes an experiment in which fish of "typical size distributions" (meaning, size distributions consistent with Text 1's note about the tendency of males to be larger than females) were placed in two tanks. Applying Text 1's model, once the males (that is, the typically larger fish) were removed from tank 1, the remaining females would no longer be at a size disadvantage and could potentially defend territory as males at their current size, making sex change advantageous for some of the fish in tank 1. This would therefore explain the finding that 81 percent of female fish began changing into males. In tank 2, however, the continued presence of larger males meant that on average, females would not be large enough to outcompete the males for territory and would therefore have greater reproductive success by remaining female. In

this way, the size-advantage model presented in Text 1 would also account for why no fish changed sex in tank 2.

Choice A is incorrect because it claims that “even small females” could succeed as males once territories were undefended, contradicting Text 1’s emphasis on there being a “critical size threshold” for male reproductive success, wherein only male fish who were sufficiently large to defend territory would have a reproductive advantage. Under this model, small females would have more reproductive success by remaining female than by becoming male and being unable to compete with larger fish for territory. Additionally, this choice’s claim about tank 2—that “only the largest females” could take over territories—implies either that females defend territory (when the model in Text 1 makes no such claim) or that at least some females were sufficiently large to change sex and compete for territory with fish that began the experiment as males, yet the results show that no females in tank 2 did so. Choice C is incorrect. Not only is it based on a flawed understanding of the model presented in Text 1, it flatly contradicts the experimental results summarized in Text 2. While Text 1 clearly states that body size is irrelevant to female reproductive success, choice C states that the presence of males in tank 2 made differences in body size relevant to the females’ reproductive success. This choice also claims that the removal of males from tank 1 eliminated any advantage to becoming male, yet the researchers reported that 81 percent of females in tank 1 began changing sex. Choice D is incorrect because it doesn’t use the model proposed in Text 1 to explain the findings described in Text 2. It is common sense that a certain number of male fish are required for reproduction to occur in tank 1, but the model presented by Text 1 focuses on the individual reproductive benefits of protogyny, not on its potential to benefit the population by maintaining a favorable sex ratio.

▼ 49 — A

Choice A is the best answer because based on Text 2, it represents how Behrenfeld and colleagues would most likely respond to the “conventional wisdom” discussed in Text 1. The conventional wisdom cited holds the opinion that when there is species diversity within a phytoplankton population, “one species should emerge after outcompeting the rest”—that is, after being so successful in competing for resources that the other species vanish from the population. However, Text 2 explains that according to Behrenfeld and colleagues, phytoplankton are so small and spaced so far apart in the water that there is “much less” direct competition for resources within phytoplankton populations than scientists had previously thought.

Choice B is incorrect because Text 2 never discusses whether routine replenishment of ocean nutrients affects competition between phytoplankton species. Choice C is incorrect because the interspecies competition discussed in both texts is specifically between phytoplankton species, and neither text considers whether phytoplankton compete for resources with larger nonphytoplankton species. Choice D is incorrect because according to Text 2, Behrenfeld and colleagues argue that water density decreases, not increases, competition between phytoplankton species.

▼ 50 — D

Choice D is the best answer because it presents a statement about King's Cross, as depicted in Text 1, that the author of Text 2 would most likely agree with. In Text 1, Margaret associates King's Cross with "Infinity" and sees its arches as portals for an adventure whose value transcends London's mundane materialism. The author of Text 2 provides an interpretation of the novel's geography that is consistent with Margaret's vision, explaining that London represents capitalist materialism while the countryside—"accessible via King's Cross"—fosters idealism, authentic connection, and the aesthetic ("the infinite"). By characterizing King's Cross as a "point of connection between London and the countryside" that offers access to the "intangible abundance" promised by "the novel's rural spaces," choice D provides a reading of the railway terminal that aligns with the interpretive framework set up by the author of Text 2.

Choice A is incorrect because Margaret views King's Cross positively—as evoking infinity and eternal adventure—not as a sign of capitalism's dominance. Text 1 characterizes St. Pancras's splendors as "facile," or superficial, so that the contrast elevates King's Cross rather than signaling materialism's ascendancy. Choice B is incorrect because the author of Text 2 positions King's Cross as a gateway to the countryside's idealism, not as a vehicle for materialism intruding into rural spaces. Margaret's sense of wonder at the station arises from her sense that it offers access to the countryside's idealism rather than to London's materialism. Choice C is incorrect because nothing in Text 1 suggests Margaret is disillusioned; her perception of King's Cross is defined by expansive possibility, not resignation. Moreover, Margaret finds the austerity of King's Cross (relative to St. Pancras) appealing—its unpretentious appearance resonates with her attitude toward the "materialism of life."

▼ 51 — D

Choice D is the best answer. According to the author of Text 1, Moore's definition of common sense—things we instinctively know are true—includes the belief that we all "exist in a world with other objects." The author of Text 1 describes this notion as both "obvious" and "groundbreaking." So it's safe to infer that the author would observe that Moore would respond to external world skeptics by arguing that since everyone instinctively knows that things exist outside of their own minds, then external world skepticism must be wrong.

Choice A is incorrect. We can't infer that the author of Text 1 would respond this way to external world skeptics. If anything, the author of Text 1 seems to agree with Moore. Choice B is incorrect. We can't infer that the author of Text 1 would respond this way to external world skeptics. The author of Text 1 never mentions external world skeptics directly, let alone why they have a hard time refuting Moore's position. Choice C is incorrect. We can't infer that the author of Text 1 would respond this way to external world skeptics. Text 1's presentation of Moore's concept of common sense only includes the idea that some facts are true based on instinct—it doesn't mention the idea that some proofs are inadequate based on instinct.

▼ 52 — D

Choice D is the best answer. Ishii and O'Mahony were trying to isolate the pure umami flavor, while Jünger was trying to recreate soy sauce, which has a mix of flavors that includes umami. Accordingly, the broths from Text 1 are not described as having any soy sauce in them—just "shiitake mushrooms and kombu seaweed." So they probably don't have as much of the dipeptides described in Text 2, which were found to be a key part of soy sauce's umami-ness and its saltiness.

Choice A is incorrect. Neither text supports this. Neither text gets into the diets of people in the United States, nor the diets of people in Japan. Choice B is incorrect. Neither text supports this. Text 2 does talk about the molecular weights of chemical compounds, but there isn't enough information provided about molecular weights in Text 1 to make an inference about what the scientists in Text 1 would say. Choice C is incorrect. Neither text supports this. Text 1 briefly mentions that soy sauce is "made from fermented soybeans," but it never claims that fermentation is responsible for its flavor in any way. And Text 2 never mentions fermentation at all.

▼ 53 — D

Choice D is the best answer. Author 1 acknowledges that Lewis sculpted other subjects besides historical and mythical figures, suggesting a variety of subjects depicted. Author 2

mentions that Lewis carved portrait busts as well as historical sculptures, which also implies variation among Lewis's subjects.

Choice A is incorrect. Neither text suggests that Lewis's portrait busts have received more attention or appreciation than her other work. Author 1 briefly mentions her "other works," but mostly focuses on her historical and mythical works. Author 2 states that art historians have typically ignored her portrait busts, which suggests that they haven't overshadowed her other work. Choice B is incorrect. Neither text explicitly states that *The Death of Cleopatra* is Lewis's most famous piece. Author 1 mentions it as one example of her historical works, but does not single it out as being more important or influential than *Hagar*. Author 2 does not mention it at all, focusing instead on her portrait busts. Choice C is incorrect. This choice isn't supported by the texts. Neither text suggests that sculpting historical figures was a trend that faded quickly.

▼ 54 — B

Choice B is the best answer because it describes the most likely way that Graeber and Wengrow (Text 2) would respond to the "conventional wisdom" presented in Text 1. According to Text 1, the conventional wisdom about human social systems is that they developed through stages, beginning with hunter-gatherer bands, then moving to clan associations, then chiefdoms, and finally arriving at states with bureaucratic structures. Text 2 indicates that Graeber and Wengrow believe that human social systems have been flexible, shifting between different types of structures, including both hierarchical and collective systems, and that these shifts may have even occurred seasonally. This suggests that Graeber and Wengrow would dispute the idea that developments in social structures have followed a linear progression through distinct stages.

Choice A is incorrect because nothing in Text 2 suggests that Graeber and Wengrow believe that decentralized collective societies are more significant than hierarchical systems. Text 2 is focused on Graeber and Wengrow's view that humans have flexibly shifted among various social structures, not on the importance of particular structures relative to others. Choice C is incorrect because Text 2 doesn't include any information suggesting that Graeber and Wengrow believe that hierarchies didn't emerge until after the rise of agriculture. In fact, Text 2 indicates that Graeber and Wengrow cite evidence suggesting that some hunter-gatherer groups formed social structures with hierarchical elements ("communities that included esteemed individuals") 50,000 years ago, long before the rise of agriculture, which Text 1 says occurred around 12,000 years ago. Choice D is incorrect because there's no information in Text 2 suggesting that Graeber and Wengrow would challenge the assumption

that groupings of hunter-gatherers were among the earliest forms of social structure. Although Text 1 does indicate that hunter-gatherer groups are assumed to be the earliest human social system, Text 2 says only that Graeber and Wengrow believe that some hunter-gatherer groups made use of different social structures at different times. Text 2 doesn't imply that Graeber and Wengrow doubt that hunter-gatherer groups preceded most other social structures.

▼ 55 — C

Choice C is the best answer because it reflects how Putirka and Xu (Text 2) would likely characterize the conclusion presented in Text 1. Text 1 discusses a study by Mark Holland and colleagues in which they detected traces of lithium and sodium in the atmospheres of four white dwarf stars. The team claims that this supports the idea that exoplanets with continental crusts like Earth's once orbited these stars. Text 2 introduces Putirka and Xu, who indicate that sodium and lithium are present in several different minerals and that some of those minerals might exist in types of rock that are not found on Earth. Therefore, Putirka and Xu would likely describe the conclusion in Text 1 as questionable because it does not consider that lithium and sodium are also found in rocks that are not like Earth's continental crust.

Choice A is incorrect because the texts do not indicate how widely held any of the viewpoints described are. Choice B is incorrect because neither text discusses how new this area of study is. Choice D is incorrect because neither text discusses how likely lithium and sodium are to be detected by analyzing wavelengths of light.

▼ 56 — D

Choice D is the best answer because it accurately describes how the author of Text 2 would most likely respond to the underlined claim in Text 1. Text 1 indicates that Storey found a genetic mutation in South American chickens from before the European invasion and in Polynesian chickens, which implies that chickens were first brought to South America by Polynesian people. Text 2 explains that the genetic mutation Storey found is in chickens from all over the world, thus undercutting the mutation as evidence of a Polynesian origin. However, Text 2 goes on to say "[m]ore recently" Luzuriaga-Neira and colleagues found multiple genetic markers shared by South American and Polynesian chickens but "that European breeds lack," which strongly suggests a Polynesian origin for the South American chickens. This indicates that the author of Text 2 believes Luzuriaga-Neira's evidence for a Polynesian origin is compelling while Storey's evidence has been undermined. Thus, the

author of Text 2 would most likely agree with the underlined statement and believes Luzuriaga-Neira and colleagues' evidence for the statement is stronger than Storey's evidence is.

Choice A is incorrect because both texts indicate that chickens were introduced to South America before the arrival of Europeans. Text 1 states that the El Arenal chicken bone dates from "1321–1407 CE—over a century before Europeans invaded the region" and concludes that these chickens were likely brought to South America by Polynesians. While Text 2 is not as explicit about the time period as Text 1 is, nothing in Text 2 undermines the timing of events ascribed to Storey's account in Text 1. Choice B is incorrect because both texts agree that chickens were first brought to South America by Polynesian peoples (the underlined claim), and nothing in Text 2 suggests that this claim is in any way deficient because the possibility that animals could have been transferred from South America to Polynesia was not explicitly addressed. Choice C is incorrect because the criticism that Text 2 raises about the ideas in Text 1 is specifically about whether the single genetic mutation cited by Storey in fact supports the idea of a Polynesian origin for South American chickens. There is nothing in Text 2 to suggest that the underlined sentence (Storey's conclusion) is deficient because it is based on an assumption about the genetic uniformity of European chickens.

▼ 57 — A

Choice A is the best answer. The author of Text 2 argues that Morrison's use of the sermon is not only influenced by Ellison, but also by a "community-wide strategy of resistance" to literary conventions practiced by Black American authors. Ellison, Text 2 alleges, is only one of many influences on Morrison.

Choice B is incorrect. Neither text specifically mentions sermons in works by authors other than Morrison or Ellison, only a tendency towards eroding "the division between oral and written forms" among Black American writers. Choice C is incorrect. Both texts describe similarities between the works of Ellison and Morrison, and neither points out instances of divergence. Text 2 simply suggests that Morrison was influenced by more than just Ellison. Choice D is incorrect. While Text 2 does discuss Morrison's resistance to certain literary conventions, it's unclear what it would mean for the underlined claim to be "indebted" to that tradition. This choice recycles language from the text, but not in a way that makes any coherent point.

▼ 58 — C

Choice C is the best answer. Text 2 states that the researchers used cosmogenic nuclide dating to "avoid the potential for misdating" caused by the geology of Sterkfontein, which Text 1 describes as "challenging" and unreliable.

Choice A is incorrect. Neither text suggests that the *A. africanus* fossils have been "corrupted," but only that traditional dating methods are difficult in Sterkfontein because of floods and soil mixing where the fossils were found. Nothing is implied to have compromised the fossils themselves. Choice B is incorrect. This choice misreads Text 2. Text 2 agrees that stratigraphy and other methods are prone to error in the context of Sterkfontein: there's a "potential for misdating" when evaluating age based on soil layers and bones. Choice D is incorrect. Text 2 does not state that cosmogenic nuclide dating is applied to the fossils directly but rather to the breccia that surrounds them.

▼ 59 — D

Choice D is the best answer because it reflects how the author of Text 1 would most likely respond to Text 2 based on the information provided. Text 2 discusses how the inconsistent use of credits to identify the contributors to video games can pose an obstacle to scholars of the medium, who rely on such credits to answer questions about the medium's development. Text 1 notes that in film and television, on the other hand, credits are used consistently and are valuable to researchers studying the cast and crew members in these mediums. Since Text 1 asserts how the consistent use of credits benefits scholars of film and television, it can be inferred that this text's author would respond to the discussion in Text 2 by observing that the kind of problem faced by scholars of video games—the inability to know who contributed to a particular production and how—is, in film and television studies, largely prevented by the widespread practice of credits in these mediums.

Choice A is incorrect. Although Text 1 discusses a method used by film and television researchers—namely, relying on credits to research the careers of cast and crew members—the author doesn't explicitly recommend that or any other method. Moreover, Text 1 states that films and television shows themselves, not their researchers, regularly use the method of listing credits. Choice B is incorrect. It can be inferred from Text 2 that when video games do feature credits, they have essentially the same function as credits in film and television—namely, to identify the individuals who worked on a particular production. Therefore, it is unlikely that the author of Text 1 would characterize video game credits as differing in purpose from film and television credits. Choice C is incorrect because, as Text 2 explains, credits are not consistently used in video games. Therefore, it is unlikely that the author of Text 1 would argue that scholars of the medium discussed in this text—video games—rely

more heavily on credits than scholars of film and television, two mediums where credits consistently appear.
